

Overview: Decentralized Finance App

Designed the web and mobile interfaces for a DeFi dApp focused on the \$CYCLE token. The app lets users swap tokens, add/remove liquidity, stake and farm, buy \$CYCLE, view portfolio, and access learning content.

I handled the full interface design in Figma and collaborated with a Web3 developer on GitHub for implementation.

My Role
Ux Designer

My Responsibility

Designed the dApp interfaces and worked with a Web3 developer on implementation.

The Problem

Users struggled to understand how to swap tokens, add liquidity, or buy \$CYCLE without making errors. Most found DeFi interfaces overwhelming due to complex terms, unclear flows, and poor visual feedback. These issues caused high drop-offs during wallet connection and transaction confirmation.

Design Process

Design Goals

Create a simple, trustworthy, and consistent DeFi experience that helps users complete transactions with confidence across web and mobile.

Simplify Core Actions

Make swaps, liquidity, and \$CYCLE purchases clear and easy to follow, even for new users.

Build Trust Through Clarity

Use clean visuals, confirmations, and status cues to help users feel safe during every transaction.

Ensure Cross-Platform Consistency

Maintain the same design system and usability across web and mobile versions.

Guide Users From Learning to Action

Integrate educational elements that help users understand DeFi concepts while using the app.

Research Findings

- Many users avoid swaps due to unclear confirmations.
- Users want clear token balances and warnings about slippage.
- Visual guides and progressive disclosure increase confidence.

Competitive Analysis

Services	BCL Swap	Zerion	PancakeSwap
Clear onboarding flow	✓	✗	✗
Beginner-friendly swapping	✓	✓	✗
Integrated learning	✓	✗	✗
Visual transaction feedback	✓	✓	✓
Wallet connection guide	✓	✗	✓

Empathy Map

User Persona

Michael

AGE: 34
EDUCATION: Bachelor's degree
STATUS: Married
OCCUPATION: Software Engineer
LOCATION: Chicago, Illinois

“I like the idea of DeFi giving people control, but most apps feel built for developers, not users. I just want a clean, safe interface where I know exactly what's happening when I click confirm.”

Brief Story
Michael invests in crypto casually. He's confident with tech but finds most DeFi platforms too complex. He wants an easy way to swap tokens, join liquidity pools, and buy project tokens without worrying about errors or hidden risks.

Goal
Invest using the dApp without confusion.

Challenges
• Overwhelming dashboards
• Poor guidance on risks
• Unclear confirmations
• Hidden fees

Sources of Information
• Twitter and YouTube
• Reddit crypto forums
• Telegram groups
• Tech blogs

Motivations
• Financial control
• Early access to trends
• Simple UI
• Learning by doing

Information Architecture

User Journey Map

Solution

I designed a clean, conversion-focused decentralized app interface for Block Cycle Labs that makes DeFi actions simple for everyday users.

The design merges complex blockchain functionality with an intuitive experience across mobile and web.

Key Highlights

- Clear wallet connection flow for faster onboarding.
- Unified dashboard showing all core actions: stake, swap, send, and pool.
- Real-time token metrics and performance insights for transparency.
- Minimal, consistent design system built in Figma for scalability.
- Collaborated with a web3 developer on GitHub to ensure pixel-perfect implementation.

Impact

Users could easily connect, navigate, and transact without confusion—bridging the gap between DeFi complexity and usability.

Wireframe & Initial Thoughts

Before diving into high-fidelity design, I created simple wireframes in Figma to map out the core user flows—connect wallet, swap tokens, stake, and view metrics.

My goal was clarity.

Every screen needed to guide users without extra clicks or technical confusion.

Design Elements

The visual design focused on building trust and simplicity in a complex DeFi environment.

Each element was chosen to balance functionality with clarity.

Homepage

Introduces the platform and prompts users to connect their wallet. Shows token highlights when unconnected and unlocks full dashboard access once connected.

Stake Page

Lets connected users view, add, or edit token stakes. Displays APY, rewards, and staking history in a simple, clear layout.

Docs Page

Shares the platform data like supply, distribution, and APY. Builds user trust through transparent, easy-to-read metrics.

Swap Page

Enables connected users to swap, send, or pool tokens. Shows balances, token options, and live transaction feedback.

Lesson Learned

Designing for DeFi showed how clarity drives trust. Simplifying complex wallet and token actions made users more confident. Visual consistency and real-time feedback proved key in reducing confusion and drop-offs.

Collaboration with developers also highlighted the value of aligning design with technical logic early.

Lesson Learned

- Expand usability testing with real users to refine flows.
- Add in-app tutorials for new DeFi users.
- Improve mobile responsiveness for smoother wallet connections.
- Introduce light and dark modes for accessibility.
- Track user behavior with analytics to guide future design updates.
